

Marvlix® - Cordyceps Sinensis

Alternative Cancer Treatment

One of the most amazing benefits of Marvlix is its anti-cancer effect. An increasing number of doctors worldwide recommend *Cordyceps* as an alternative, or addition to chemotherapy, radiation or other traditional cancer treatments.

Cordyceps has been used successfully to **inhibit the growth of cancer cells**, and to help dissolve cancerous tumors.

In addition, clinical studies have proven that Cordyceps enhances and strengthens the immune system, enabling the body to manage its immune resources more efficiently while undergoing the stress of cancer attack.

This secondary effect is extremely important for patients going through chemotherapy or radiation treatment, **strengthening the body against the toxic side effects of those treatments**. It is no secret that many cancer patients die of opportunistic infections during chemotherapy rather than from the cancer itself. The use of Marvlix **minimizes the risk of complication**.

Many clinical studies of cancer patients have shown positive results. In one study, 50 lung cancer patients were treated with 6 grams of Cordyceps daily, in conjunction with chemotherapy. Tumors were reduced in size in 46% of the patients.

In a trial involving cancer patients with several different types of tumors, a majority of those treated for two months with 6 grams of Cordyceps daily, reported improved subjective symptoms. In approximately 50% of the patients, white blood cell counts remained high, while tumor size was significantly reduced.
