

Marvlix® - Cordyceps Sinensis

Reduce Drug Toxicity

In addition to their benefits, many popular drugs are accompanied by considerable levels of toxicity. The incorporation of Marvlix into the treatment regimen will result in a **significant reduction of toxicity or side effects** from synthetic drugs, while sacrificing none of their efficacy.

Organ transplant cases offer a good example of how Cordyceps can be used in conjunction with pharmaceuticals.

Cyclosporin is a drug frequently used in cases of organ transplant, but it is highly toxic. Many patients suffer serious kidney damage after using Cyclosporin. In a 1995 clinical study, 69 kidney transplant patients were given either Cyclosporin alone, or in conjunction with 3 grams of Cordyceps sinensis daily. After 15 days the group receiving Cyclosporin along with Cordyceps showed a much lower incidence of kidney failure than the group receiving Cyclosporin alone.
