EZorb Calcium® Calcium Aspartate Anhydrous

What is in EZorb Calcium®?

EZorb Calcium is composed of calcium aspartate anhydrous, an organic compound extracted from land-based plants by way of Elixir Industry's proprietary technology.

Unlike traditional calcium compounds such as calcium carbonate, calcium citrate, and calcium gluconate, EZorb doesn't need stomach digestion. It is absorbed in the small intestine in its original form.

EZorb has extended calcium absorption to the entire length of small intestine. The product doesn't cause any discomfort in the digestion tract, while traditional calcium compounds are known for causing stomach upset, constipation, etc.

More importantly about EZorb though, is its ability to raise bone, joint and muscle metabolism. Most if not all bone, joint and muscle related problems such as osteoporosis, bone spurs, arthritis, fibromyalgia, are associated with weakened bone, joint and muscle metabolism. EZorb gets to the root cause of those diseases by raising the metabolism. That's why it's so effective.
